Operators, Eigenvalues, ? Eigenvecturs () As we have begun to build up our understanding of kets and linear algebra representation of QM, we begin to extend it by understanding that much of QM is solving the "Eigenvalue Problem". - Two critical postulates result in the Eigenvalue Koblem traming. Postulate 2: a physical observable is représente by an operator acting on a ket Rostrlate3: The only possible measurement of an observable is an eigenvalue of the operator. Let's start with the elgenvalue equations for our spin 1/2 system:

$$S_{2}|+\rangle = \frac{+\pi}{2}|+\rangle$$

$$\sum_{k=1}^{n} \sum_{j=1}^{n} \sum_{$$

eigenvalues it must be represented
by a Square 2x2 matrix.

$$S_{z} \stackrel{\circ}{=} \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$
In addition because it produces
real eigenvalues it must
also be Hermitian. (More on
that later)
With $S_{z} \stackrel{\circ}{=} \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ We can
determine the elements by
Working through the eigenvalue publicum

$$0 S_{z}|+\rangle \stackrel{\circ}{=} \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} l \\ 0 \end{pmatrix} = +\frac{\pi}{2} \begin{pmatrix} l \\ 0 \end{pmatrix}$$

$$2 S_{z}|-\gamma \stackrel{\circ}{=} \begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 0 \\ l \end{pmatrix} = -\frac{\pi}{2} \begin{pmatrix} 0 \\ l \end{pmatrix}$$

Is the same as the original
Matrix.

$$S_{z} \doteq \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \xrightarrow{confluxt conj} S_{z} \doteq \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 & -1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\xrightarrow{b_{z}} \sum_{i=1}^{i} \frac{\pi}{2} \begin{pmatrix}$$

 $S_{y} \stackrel{\circ}{=} \frac{\pi}{2} \begin{pmatrix} \circ \\ \circ \end{pmatrix} \qquad S_{y} \stackrel{\circ}{=} \frac{\pi}{2} \begin{pmatrix} \circ \\ \circ \end{pmatrix} \qquad S_{z} \stackrel{\circ}{=} \frac{\pi}{2} \begin{pmatrix} \circ \\ \circ \end{pmatrix}$ 6 Operators more generally - operators have the same dimensions as the basis of the system under investigation. ("Hilbert Space") -For Spin 1/2 > 2 eigenvalues -> 2×2 Spin 1 -> 3 elgenvalues -> 3×3 Spin 3/2 -> 4 eigenvalus -> 4×4 etz. What characterizes the operator in its matrix representation are the Values that it carries -> it Matrix elements a general Matrix Plenuat is given by < bra OPERATOR / bet >

For a spin 1/2 system with the
$$\overrightarrow{P}$$

usual basis 1+7, 1-7 an operator
Would be represented as,
 $A \stackrel{\circ}{=} \begin{pmatrix} \langle + |A| + \rangle & \langle + |A| - \rangle \\ \langle -|A| + \rangle & \langle -|A| - \rangle \end{pmatrix}$
For a spin 1 system, we might have
a basis like 1+2, 102, 1-7. So
eigenvalues = \overrightarrow{H} of $-\overrightarrow{H}$
the operator \overrightarrow{H} is represented,
 $A \stackrel{\circ}{=} \begin{pmatrix} \langle +|A| + \rangle & \langle +|A|0 \rangle & \langle +|A|0 \rangle \\ \langle 0|A| + \rangle & \langle 0|A|0 \rangle & \langle 0|A| - \rangle \\ \langle -|A| + \rangle & \langle -|A|0 \rangle & \langle -|A| - 2 \end{pmatrix}$

All of this work to develop these representations leads us to an important idea in QM.

Big I dea à Diagonalization of Operators QM operators that represent physical Observables have real eigenvalues. The process of Diagonalization lets you find the eigenvalues and eigenvectors of the operator. This is very important for determining energy spectra (energy eigenvalues) and the associated states (energy eigenstates) Example: Eigenvalus ? Eigenstates of Sy What are the eigenvalues & eigenstates of Sy? $S_{y} \stackrel{\circ}{=} \frac{\pi}{2} \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}$ Solution: This is a two step process (1, then (27) First, we setup the eigenvalue equ. where & are the unknown eigenvalues and IX are the

unknown eigenstates.

$$Sy | \lambda 7 = \lambda | \lambda \rangle$$

$$(Sy - \lambda) | \lambda \rangle = 0$$
Solutions to this equation only
exist if

$$det | Sy - \lambda I | = 0 \quad I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$
So we solve this,

$$det | \begin{pmatrix} 0 & -it/2 \\ it/2 & 0 \end{pmatrix} - \lambda \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} | = 0$$

$$det | \begin{pmatrix} -\lambda & -it/2 \\ it/2 & -\lambda \end{vmatrix} = 0$$

$$\lambda^{2} - \frac{t^{2}}{4} = 0 \quad \lambda^{2} = \pm \frac{t}{2} \begin{pmatrix} as \\ expected \end{pmatrix}$$
So we got two eigenvalues as we should
have gother and they are distinct
("not degenerate").

Each eigenvalue gives rise to an eigenstate,
so we now use each
$$\lambda$$
, we can find (1)
the associated eigenstates, $1 \\> \\$
With $\lambda = +\frac{\pi}{2}$ $1 \\> = \binom{a}{b}$ (unknown adb)
 $S_{\gamma}/\lambda > = +\frac{\pi}{2} \\| \\> \\\frac{\pi}{2} \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \begin{pmatrix} q \\ b \end{pmatrix} = \frac{\pi}{2} \begin{pmatrix} a \\ b \end{pmatrix}$
 $\begin{pmatrix} -ib \\ ia \end{pmatrix} = \begin{pmatrix} a \\ b \end{pmatrix}$ so,
 $b = ia$ in both cases
This isn't enough information to determine
 $a \\ b \\ B \\ be normalized$.
 $\\ \\> \\> \\= |a|^{2} + |ia|^{2} = 2a^{2} = 1$ $a = \frac{1}{\sqrt{2}}$
So that,
 $b = \frac{i}{\sqrt{2}}$
Thus the eigenstate is $\frac{1}{\sqrt{2}} \begin{pmatrix} i \\ i \end{pmatrix}$

B/c this is for Sy
$$\alpha \lambda = \frac{+\pi}{2}$$
 (1)
We label it with the ket $1+\frac{1}{2}$,
 $1+\frac{2}{\sqrt{2}} = \frac{1}{\sqrt{2}} (\frac{1}{2})$

We can perform similar calculations for $\lambda = -\frac{\pi}{2}$ and for Sx. We would end up with,

$$\begin{array}{c} 1+7\gamma \stackrel{e}{=} \frac{1}{72} \begin{pmatrix} l \\ l \end{pmatrix} \quad 1-7\gamma \stackrel{e}{=} \frac{1}{72} \begin{pmatrix} l \\ l \end{pmatrix} \\ 1+7\gamma \stackrel{e}{=} \frac{1}{72} \begin{pmatrix} l \\ l \end{pmatrix} \quad 1-7\gamma \stackrel{e}{=} \frac{1}{72} \begin{pmatrix} l \\ l \end{pmatrix} \end{array}$$

- Now that we have built up this structure We can understand how some of The more confising QM experiments

produce the masimements we 12 have seen. - The projection operators we will develop provide the mathematical toundation that explain these experiments. Let's losk at how we construct these operators for a spin 1/2 system. Starting with a general state in the Sz basis, 147 = a/+7 + b/-7 coeffs. $= (\langle +|\psi\rangle)|+ > + (\langle -|\psi\rangle)|->$ We can more the kets around, *|*47 = *|*+> <+*|*47 + *)*-><-*|*47

= (1+)<+1+1-><-1)must be equal to 1.

$$|+> <+|+|-> <-|=1 \quad \begin{array}{c} \text{completeness} \\ \text{relationship} \end{array}$$

The Matrix representation of this is
formed by computing the "outer product",

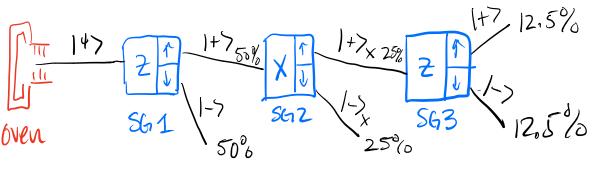

$$|+> <+|+|-> <-|\stackrel{\circ}{=} \begin{pmatrix} 1\\ 0 \end{pmatrix} \begin{pmatrix} 10 \end{pmatrix} + \begin{pmatrix} 0\\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 0 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

J

Why is this useful? The projection operator 14 is like a "dot product". It returns a ket aligned with the projection eigenstate and gives the amplitude and phase for that state to be measured in the associated eigenstate. $Y_{+}|\psi 7 = |_{+} > \langle_{+}|\psi 7 = (\langle_{+}|\psi 7)|_{+} >$ Amp & phase, a $P_{-}|\psi\rangle = |-\rangle\langle -|\psi\rangle = (\langle -|\psi\rangle)|-\rangle$ Ampaphase, b Relationship de Measurement As we have seen, a measurement results in finding a system in a particular state with a particular probability. We can determine that ket trom projection operators. (poshlate J)

Probability =
$$P_{+} = |\langle + |\psi \rangle|^{2}$$
 No tail (5)
= $\langle +|\psi \rangle^{*} \langle +|\psi \rangle = \langle +|+\rangle \langle +|\psi \rangle$
= $\langle +|P_{+}|\psi \rangle$
Thus, the new state is given by,
 $|\psi' \rangle = \frac{P_{+}|\psi \rangle}{|\langle +|P_{+}|\psi \rangle} = |+\gamma$
or in general for P_{n} (Some projector.)
 $|\psi' \rangle = \frac{P_{n}|\psi \rangle}{|\langle +|P_{n}|\psi \rangle}$

In 2.2.4, McIntyre uses this frame work to show how this experiment works.

(6 Expectation Valves - As QM is entirely probablistic, it Makes Sense to understand what we might expect (on average) from a given operator for a given system. This approach is based on probability theory where the mean value is determined by a Weighted average. For 52, $\langle S_{z} \rangle = \frac{+\hbar}{2}P_{+} + \left(\frac{-\hbar}{2}\right)P_{-}$ as $P_{+} = |\langle +|\psi \rangle|^{2}$ and $P_{-} = |\langle -|\psi \rangle|^{2}$ $\langle S_{z} \rangle = \frac{4\pi}{2} |\langle + |\Psi \rangle|^{2} + (-\frac{\pi}{2}) |\langle - |\Psi \rangle|^{2}$ = + なくり+> イ+14> + (-き) く+1-7く-14> $= \langle \Psi | \left| \frac{4\pi}{2} \right| + 2 \langle + | \Psi \rangle + \left(-\frac{\pi}{2} \right) | - 2 \langle - | \Psi \rangle \right]$ $= \langle \Psi | [S_2| + \rangle \langle + | \Psi \rangle + S_2 | - \rangle \langle - | \Psi \rangle$

$$= \langle \Psi | S_{z} [1 + \gamma \langle + | + | - \gamma \langle - |] | \Psi \rangle^{P}$$

$$\frac{1}{\langle S_{z} \rangle} = \langle \Psi | S_{z} | \Psi \rangle \qquad \text{expectation value} \\ \text{using operators of} \\ \text{State vectors} \\ \text{In general, we can find size} \\ \text{expectation value of any operator using either} \\ \text{approach,} \end{cases}$$

$$\langle A \rangle = \langle \Psi | A | \Psi \rangle = \sum_{n} P_{n} a_{n}$$

Example: Computing
$$\langle S_z^2 \rangle$$
 for $|\pm\rangle |\pm\rangle |\pm\rangle$
Let's compute the expectation value of
the operator S_z^2 for both $|\pm\rangle |\pm\rangle |\pm\rangle$.
for $|\pm\rangle$,
 $\langle S_z^2 \rangle = \langle \pm |S_z^2| \pm \rangle = \langle \pm |S_z S_z| \pm \rangle$

$$\begin{split} \langle S_{2}^{27} &= \langle + | S_{2} \frac{1}{2} | + \rangle = \frac{1}{2} \langle + | S_{2} | + \rangle \\ \langle S_{2}^{27} &= \frac{1}{4} \frac{1}{4} \langle + | + \rangle = \frac{1}{4} \end{split}$$

For 1-7, $\langle s_{z}^{2} \rangle = \langle -1 \rangle s_{z}^{2} [-7] = \langle -1 \rangle s_{z} s_{z}]-7$ $\langle s_{z}^{2} \rangle = \langle -1 \rangle s_{z} (-\frac{\hbar}{z}) |-7] = -\frac{\hbar}{z} \langle -1 \rangle s_{z} |-7$ $= \frac{\hbar^{2}}{4} \langle -1 - 7] = \frac{\hbar^{2}}{4}$

Commutation

Finally, lets look into why we are unable to measure Sx, Sy, and Sz at the same time.

Commuting is something we take for granted in algebra. You would find it bankers if someone told you that

5x 7 x 5
But my object kid still doesn't belive
these two equations are the same.
Her stopticism is what you weld to
bring to QM b/c here we have
Non commutative digebra. And
this commutation is central to
whether two observables can be measured
together.
The commutator is given by,

$$[A,B] = AB - BA$$

In most of your experience so far,
 $[A,B] = O$ $AB - BA = O$
and thus $AB = BA$
this is how negular algebra works.

When two operators commute they share 20 eigensteutes (i.e. one measurement is a proxy for the other), so you can masure both observables together. Assume AB=BA, Let $A|a\rangle = a|a\rangle$ eigenvalue à eigenstate. then, BAJa7 = BaJa7 the state Blar 13 ahd AB|a7 = qB|a7 (an eigenstate of A So We can measure A SD, A(B|a>) = a(B|a>)of B"at the same time! Non commuting Observables This is far more Common Hear you think in QM. Take Sx a Sz for example, $[S_z, S_X] = S_z S_X - S_X S_z$ $\stackrel{\circ}{=} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \frac{\pi}{2} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} - \frac{\pi}{2} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \frac{\pi}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$

$$= \left(\frac{\pi}{2}\right)^{2} \left[\begin{bmatrix} 0 & 1 \\ 0 & -1 \end{bmatrix} \left(\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \right) - \left(\begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \right)^{2} = \left(\frac{\pi}{2}\right)^{2} \left(\begin{bmatrix} 0 & 2 \\ -2 & 0 \end{bmatrix} \right)^{2}$$

$$= \left(\frac{\pi}{2}\right)^{2} \left(\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} \right)^{2} = \left(\frac{\pi}{2}\right)^{2} \left(\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} \right)^{2}$$

$$S_{0} \text{ flat}$$

$$[S_{x}, S_{z}] = i\pi S_{y}$$

$$In \text{ fact},$$

$$[S_{x}, S_{y}] = i\pi S_{z}$$

$$[S_{y}, S_{z}] = i\pi S_{x}$$

$$[S_{z}, S_{x}] = i\pi S_{y}$$
