

Could this be a plot of  $|\mathbf{E}(r)|$ ? Or  $V(r)$ ? (for SOME physical situation?)

- A. Could be  $E(r)$ , or  $V(r)$
- B. Could be  $E(r)$ , but can't be  $V(r)$
- C. Can't be  $E(r)$ , could be  $V(r)$
- D. Can't be either
- E. ???

# EXAM 1 INFORMATION

- Exam 1 on Wednesday, October 4th (A149 PSS)
  - Across from FRIB (Wilson side)
- 7pm-9pm
  - Arrive on time!
- I will provide a formula sheet (posted on Piazza already)
- You can bring one-side of a sheet of paper with your own notes.
- 4 questions - True/False, Essay, Graphing, Calculations

# WHAT'S ON EXAM 1?

- Identify whether conceptual statements about  $\mathbf{E}$ ,  $V$ ,  $\rho$ , and/or numerical integration are true or false.
- Sketch and discuss delta functions in relation to charge density,  $\rho$
- Calculate the electric field,  $\mathbf{E}$ , inside and outside a continuous distribution of charge and sketch the results
- Calculate the electric potential,  $V$ , for a specific charge distribution and discuss what happens in limiting cases

We usually choose  $V(r \rightarrow \infty) \equiv 0$  when calculating the potential of a point charge to be  $V(r) = +kq/r$ . How does the potential  $V(r)$  change if we choose our reference point to be  $V(R) = 0$  where  $R$  is close to  $+q$ .

- A.  $V(r)$  higher than it was before
- B.  $V(r)$  is lower than it was before
- C.  $V(r)$  doesn't change ( $V$  is independent of choice of reference)

# ELECTROSTATIC POTENTIAL ENERGY

Three identical charges  $+q$  sit on an equilateral triangle. What would be the final  $KE$  of the top charge if you released it (keeping the other two fixed)?

- A.  $\frac{1}{4\pi\epsilon_0} \frac{q^2}{a}$
- B.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{3a}$
- C.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{a}$
- D.  $\frac{1}{4\pi\epsilon_0} \frac{3q^2}{a}$
- E. Other

Three identical charges  $+q$  sit on an equilateral triangle. What would be the final  $KE$  of the top charge if you released *all three*?

- A.  $\frac{1}{4\pi\epsilon_0} \frac{q^2}{a}$
- B.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{3a}$
- C.  $\frac{1}{4\pi\epsilon_0} \frac{2q^2}{a}$
- D.  $\frac{1}{4\pi\epsilon_0} \frac{3q^2}{a}$
- E. Other

Does system energy "superpose"?

That is, if you have one system of charges with total stored energy  $W_1$ , and a second charge distribution with  $W_2$ ...if you superpose these charge distributions, is the total energy of the new system simply  $W_1 + W_2$ ?

A. Yes

B. No

Two charges,  $+q$  and  $-q$ , are a distance  $r$  apart. As the charges are slowly moved together, the total field energy

$$\frac{\epsilon_0}{2} \int E^2 d\tau$$

- A. increases
- B. decreases
- C. remains constant

A parallel-plate capacitor has  $+Q$  on one plate,  $-Q$  on the other. The plates are isolated so the charge  $Q$  cannot change. As the plates are pulled apart, the total electrostatic energy stored in the capacitor:

- A. increases
- B. decreases
- C. remains constant.
